

MACHINE LEARNING

In Q1 to Q11, only one option is correct, choose the correct option:

D) It does not make use of dependent variable.

1.	Which of the following methods do we use to A) Least Square Error C) Logarithmic Loss	o find the best fit line for data in Linear Regression? B) Maximum Likelihood D) Both A andB
2.	Which of the following statement is true about A) Linear regression is sensitive to outliers C) Can't say	at outliers in linear regression? B) linear regression is not sensitive to outliers D) none of these
3.	A line falls from left to right if a slope is A) Positive C) Zero	? B) Negative D) Undefined
4.	Which of the following will have symmetric revariable? A) Regression C) Both of them	elation between dependent variable and independent B) Correlation D) None of these
5.	Which of the following is the reason for over to A) High bias and high variance C) Low bias and high variance	,
6.	If output involves label then that model is ca A) Descriptive model C) Reinforcement learning	alled as: B) Predictive modal D) All of the above
7.	Lasso and Ridge regression techniques below. A) Cross validation C) SMOTE	ong to? B) Removing outliers D) Regularization
8.	To overcome with imbalance dataset which A) Cross validation C) Kernel	technique can be used? B) Regularization D) SMOTE
9.	The AUC Receiver Operator Characteristic classification problems. It usesto match A) TPR and FPR C) Sensitivity and Specificity	(AUCROC) curve is an evaluation metric for binary like graph? B) Sensitivity and precision D) Recall and precision
10	In AUC Receiver Operator Characteristic (A curve should be less.A) True	UCROC) curve for the better model area under the B) False
11.	 Pick the feature extraction from below: A) Construction bag of words from a email B) Apply PCA to project high dimensional defention C) Removing stop words D) Forward selection 	ata
In Q12, more than one options are correct, choose all the correct options:		
12.	Regression?	Equation used to compute the coefficient of the Linear
A) We don't have to choose the learning rate.B) It becomes slow when number of features is very large.		
	C) We need to iterate	,

MACHINE LEARNING

Q13 and Q15 are subjective answer type questions, Answer them briefly.

13. Explain the term regularization?

Regularization is the process which regularizes or shrinks the coefficients towards zero. In simple words, regularization discourages learning a more complex or flexible model, to prevent over fitting.

14. Which particular algorithms are used for regularization?

There are two main types of regularization techniques: Ridge Regularization and Lasso Regularization.

Ridge Regularization

It modifies the over-fitted or under fitted models by adding the penalty equivalent to the sum of the squares of the magnitude of coefficients.

Cost function = Loss + $\lambda x \sum \|w\|^2$

Lasso Regression

It modifies the over-fitted or under-fitted models by adding the penalty equivalent to the sum of the absolute values of coefficients.

Cost function = Loss + $\lambda x \sum ||w||$

15. Explain the term error present in linear regression equation?

An error term represents the margin of error within a statistical model; it refers to the sum of the deviations within the regression line, which provides an explanation for the difference between the theoretical value of the model and the actual observed results. The regression line is used as a point of analysis when attempting to determine the correlation between one independent variable and one dependent variable.

$$Y = \alpha X + \beta \rho + \epsilon$$

Where:

 α , β =Constant parameters

X, ρ =Independent variables

 ϵ =Error term
